

Brief Explanation of Transformation and Modeling Logic

Transformation Logic:

- Imported **List of Orders, Order Details, and Sales Target** into Power Query.
- Set appropriate **data types** for dates and numeric columns.
- Formatted CustomerName using **Proper Case**.
- Created Location by combining **City and State**.
- Created **Profit Margin** using Profit / Amount.
- Created **Profit Status** based on Profit values: Loss, Break-Even, or Profit.
- Merged **List of Orders** and **Order Details** using Order ID.
- Checked for missing and duplicate data; the assignment states that none were found.
- Created required aggregations such as **Order Count, Average Profit, Total Amount, and Total Target**.

Modeling Logic:

- **List of Orders** and **Order Details** are related using Order ID.
- **Order Details** and **Sales Target** are related using Category, as required by the assignment.
- Since Category contains repeated values in both tables, a direct **Many-to-Many** relationship is created.
- To avoid this, a unique **Category lookup table** can be created and connected to both tables using **one-to-many (1:*)** relationships.
- This provides a cleaner model and allows category-based analysis of **orders and sales targets**
